for Organizations **VERSION 1**

The new standard is based on the recognition of the following core principles:

About the Standard

The Council for Responsible Sport has developed a relevant measurement and reporting framework for the global sports event sector. The first-ever Responsible Sport Standard for Organizations is a collection of standards of good practice that have been thoroughly reviewed and revised through a robust process of stakeholder input and feedback.

events, whether participatory or spectator-oriented.

Power of Sport - Sport is a diverse, global, culturally influential platform that can engage and inspire people at nearly all scales and in any place on Earth.

Resolving Climate Change - There is an urgent need to balance (reduce) atmospheric greenhouse gases in the current decade in order to prevent the further destabilization of Earth's climate, while mitigating the harmful effects of humans'

consumptive activities and largest-in-history global population. **Enabling Social Justice** - Sport platforms that work to reduce inequities along racial and socio-economic lines enable progress towards a more equitable society. Business of Sport - Organizations must create and employ viable and ethical economic models upon which they can attempt to operate indefinitely in the marketplace.

Those who aspire to meet the new Responsible Sport Standard for Organizations will demonstrate leadership towards a world where all events are produced with a greater sense of responsibility and intention for verifiable accounting of impacts than ever before.

The standard was designed to equally balance social and environmental responsibility, and is organized into five categories. In this first collection of good practices, there are 21 indicators and 94 actions, plus a scoring system available to organizations seeking to self-assess and/or certify their adherence.

Who is this framework for? The Responsible Sport Standard for Organizations is a relevant measurement and reporting framework for the responsible management of organizations operating in the sports event sector. This collection of good practices is intended for practical application by companies and institutions that are involved with the production, hosting, and delivery of large-scale sporting

Private or public companies, organizing committees, athletic departments, production and marketing agencies, franchises and venue operators can all look to this framework for standardized guidance. This framework is for organizations wishing to operate with ecological and social purpose while accepting responsibility for the impacts of their actions and events. How the Standard was Created **Stakeholder Input Process Flow** Responsible Sport Standard for Organizations, version 1 **Sport Industry Professionals Survey Draft Responsible**

The Council for Responsible Sport owes a debt of gratitude for the contributions of many sport business professionals, event planners, community outreach leaders, diversity and inclusion experts, economists, environmental scientists and sustainability professionals. Without their voluntary support, there would be no Responsible Sport Standard for Organizations. The standard is a reflection of the growing sense of responsibility amongst a broad range of collaborators conducting business in the events sector—a movement the Council for Responsible Sport is honored to serve.

Public Comment Sport Standard for Technical and **Responsible Sport Expert Review Advisory Committee** 2020 Winter '21 The Council for Responsible Sport ensured the robust review and revision of the Responsible Sport Standard for Organizations (version 1) through a multi-pronged, 15-month process of stakeholder input and feedback that lasted from April 2020, through June 2021, when the first version of the standard was approved by the Council's board of directors. Process elements included the creation and facilitation of a 24-member advisory committee that met between July and October 2020; an

and input guided the development and drafting of the standard.

strategies both in action and planned to align the organization's vision, mission and core values to its actions. An access policy and/or plan intends to ensure that event organizers have considered the needs of populations with a wide range of sensory, ambulatory and mental capacities and/ or circumstances be they participants, staff, volunteers or spectators. Capturing and reflecting engrained actions and approaches in a written format creates consistency over time. An equity policy intends to ensure that event organizers have considered the needs of underrepresented populations (including minorities) who have been or are systematically underprivileged be they participants, volunteers or spectators. Capturing and reflecting engrained actions and approaches in a written format creates consistency over time.

improved can be helpful in measuring success against objectives. Build the values of diversity, equity, and inclusion into your organization's structure, workforce, and operations. A plan is not a solution, but rather a starting point for an organization seeking to achieve parity. This plan is comprehensive to the reporting organization as a whole, and may include or overlap with elements from 2.2 or 2.3-which are specific to event planning, but additionally should include the organization's approaches to diversification, equity, and belonging with regards to human resources, hiring, and governance. Measurement of compensation and benefits to employees in the workforce in relation to their role, gender, and ethnicity are important for identifying and correcting systemic disparities. In a market-driven labor economy with demonstrated gendered and ethnic 'pay gaps', providing fair compensation and benefits to employees in the workforce with similar roles and duties regardless of race, ethnicity and gender is important in achieving an equitable work environment. The individuals that govern organizations have significant influence on the quality of oversight and the decisions made. Publicly sharing information about governance increases the transparency of an organization.

Sharing information publicly enhances transparency amongst all stakeholders, sets a positive example, raises awareness, and can influence action. Sharing information publicly enhances transparency amongst all stakeholders, sets a positive example, raises awareness, and can influence action. For example, visitors should routinely be strongly encouraged to use public and active transit modes to travel to and from events. Communication formats might include e-mail, audio/visual messages at events, signage, booths, loudspeaker announcements. (Note: event wayfinding signage does not qualify) Sharing information publicly enhances transparency amongst all stakeholders, sets a positive example, raises awareness, and can influence action. Indirect communications formats might be sponsored content including social media posts, marketing emails, organizational newsletters, web pages, published reports, etc.) Sharing information with specific internal and external groups (e.g. staff, volunteers, contracted laborers, vendors, local governments, sponsors, delivery partners, etc.) enhances transparency, sets a positive example, raises awareness, and can influence action. Sharing case studies and examples with other event and industry professionals helps them

learn how to advocate, plan and achieve new and improved outcomes. Update and distribute timely and accurate emergency communication information. Identify everyone in events' chains of communication (e.g. event staff, volunteers, participants, suppliers, vendors, and key community partners) and establish systems for sharing information. Maintain up-to-date contact information for everyone in the chain of communication. Identify platforms, such as automated text messaging to help disseminate information. Policy should include at least the following elements: (1) explanation of processes and protocols implemented to keep children safe at the event: (2) explanation of process in case of a lost child or youth-related emergency, including staff or other contacts (e.g. policy or security personnel);(3) the plan for training/communicating the child protection protocols to event staff and volunteers, and; (4) suggestions for adult guardians to help keep kids safe at the event. Ensure that events have sanitation supplies for staff, volunteers (if applicable), guests and participants. Hand sanitizer that contains at least 60% alcohol, tissues, disposable facemasks, and disinfectants are recommended. Require staff and volunteers to stay home if they are sick or caring for a sick household member. Hand washing and sanitization are some of the best defenses against the spread of infectious disease and therefore should be widely available when people are out in public.

inquiry is the foundation of an intentional approach to hosting genuinely inclusive events. 'Underrepresented groups' typically refers to demographics such as race, ethnicity, nationality, age, household income, and primary language. Organizations with genuine commitments to diversity and inclusion will voluntarily pursue creative and ethical business models that seek to authentically address the effects of substantial, long-standing wealth inequalities, often occurring along racial and ethnic lines, but varying by place. Underrepresented groups may include national or regional racial or ethnic minorities. youth and their quardians from low-income or underserved housing, households, neighborhoods, schools, or other underrepresented peoples specific to event locales. While research and direct inquiry are the foundation of an intentional approach to hosting genuinely inclusive events, adjustments and actions in response to the feedback received through inquiry demonstrate integrity. Intentional inquiry is insufficient if not accompanied by authentic responsive action. Give people information and resources to help them learn to train properly if they have little to

Resource Management

are rewarded with customer and workforce loyalty, helping to ensure the longer-term viability of The United Nations Climate Change offers the 'Sport for Climate Action' initiative to support and guide sports actors in achieving global climate change goals. Science-based targets are goals for reducing greenhouse gas emissions that are accordant with the speed with which the best current science says that global society must eliminate the worst effects of climate change, and which align with the 2015 United Nations Paris Agreement Capturing and reflecting engrained actions and approaches in a written format creates consistency over time. The written plan document intends to identify the key social and environmental impacts of the organization's activities (including events), and summarizes Plan or policy addresses: (1) Supply chain considerations, (2) event-generated waste; (3) water; (4) direct energy (e.g. facilities, transportation) and; (5) direct and indirect greenhouse gas emissions. Administratively, it addresses (1) communication of the plan; (2) staff and volunteer training, and; (3) resources and references to assist staff and other stakeholders in achieving the goals of the plan (e.g. Responsible Sport Standards). It offers directive and priorities to guide organizers acting on behalf of the organization with intent to minimize resource use, move towards circular material flows, and identify opportunities for improvement. Internal communication within the organization clarifies leadership's position on key social and environmental issues and increases trust and acceptance of programs and initiatives by all. The 2030 Agenda for Sustainable Development, adopted by all United Nations Member States in 2015, provides a shared blueprint for peace and prosperity for people and the planet, now and into the future. At its heart are the 17 Sustainable Development Goals (SDGs), which are an urgent call for action by all countries - developed and developing - in a global partnership. They recognize that ending poverty and other deprivations must go hand-in-hand with strategies that improve health and education, reduce inequality, and spur economic growth - all while addressing climate change and working to preserve our oceans and forests. Identification of work that is relevant to achieving the SDGS is recommended, including the identification of Feedback mechanisms that assist with internal evaluation of efforts to reduce the environmental footprint and enhance the social impacts of activities help measure success In addition to internal evaluation of efforts to reduce your event's environmental footprint and enhance its social impacts, asking stakeholders what worked well, and what could be

Site assessments are useful for identifying and understanding impacts as well as clarifying priorities, threats and opportunities for improvement. Action to recognize, prevent, and minimize the potential ecological impacts resulting from sports events should be prioritized. Potential impacts include: habitat loss or modification, disturbance or damage to wildlife introduction of new flora and fauna, soil erosion and compaction, depletion of water resources, pollution, climate change and unsustainable sourcing (Brownlie, Bull, Stubbs Self-reported impacts by key event delivery partners responsible for the stewardship of event sites generates awareness of negative results and either acknowledges and accepts them, and/or helps plan to prevent them at future events held at those sites Measurement of the concentration and types of ambient air pollutants that sporting events generate is a critical step in identifying and understanding opportunities to reduce the impact of pollution and growing the body of knowledge around the impacts of air quality on athletic performance as well as athlete and event visitors' health. Measuring outdoor and indoor air quality before, during and after events and devising mitigations to keep local air quality within international standards during events and their preparations (e.g. team training) is considered good practice, particularly for large-scale events (e.g. 10,000+ person gatherings). Prioritize actions looking at synergies with (GHG) emissions reduction. Begin by identifying suspected emission sources (hotspots) and plan to quantify the impact of known sources (e.g., desert dust) with instrumentation and/or sensor technologies. The written Procurement Policy explains the full set of criteria to be considered when making purchases on behalf of the organization. When detailing purchasing protocols, the policy should explicitly state goals and tactics to increase access to contracts by local minority and women-owned businesses while identifying and prioritizing the material sustainability elements to be considered when making purchases. Sharing information internally is necessary to influence policy implementation. Cost flexibility is a mechanism that allows the consideration of factors of environmental and social impact and value that have historically been overlooked or labeled as 'externalities' in favor of lowest-cost only policies. Equipping people with the power to make decisions that align with the organizations stated social and environmental values and intentions puts the Creating pathways for information gathering is essential to accurate measurement and The industrial system upon which the modern market economy grew is inherently

degenerative, featuring a cradle-to-grave manufacturing supply chain fueled by nonrenewable fossil fuels that runs counter to the living world, which thrives by continually recycling life's building blocks such as carbon, oxygen, water, nitrogen and phosphorus. (Raworth, 2017). Seeking to eliminate externalities and re-align with nature's ability to continually undo and regrow materials is the essence of the pursuit of sustainability. Bolster waste reduction in supply chains by prompting partners and suppliers to reduce or eliminate paper use, packaging, cans, cartons, plastic wrap and other materials used to package goods and supplies, and to utilize reusable and locally recyclable options when Measurement of change over a baseline year is a tactic that helps track performance towards goals over time, analyze data, and assists with communicating the results of programs and Giveaways that support an environmentally conscious lifestyle (e.g. grocery bags, beverage vessels) set a good example and create demand for sustainable goods while reducing demand Support the local economies and homegrown businesses where events are held. Support a more equitable economy by contracting with women and minority-owned Support a more environmentally sustainable economy by contracting with businesses certified in accordance with industry best practices for event-related production needs Reduce deforestation and waste by utilizing and creating market demand for recycled content Incorporating environmental terms into procurement processes helps organizations incorporate the value of nature and its services by demonstrating the intention to make Incorporating environmental terms into food and beverage selection processes helps organizations demonstrate and communicate willingness to make choices that cause less A key element of environmental sustainability is the concept of continual use and re-use of materials. 'Circular' systems employ reuse, sharing, repair, refurbishment, remanufacturing and recycling to minimize the use of raw resource inputs and the creation of waste, pollution and Support a more resource conscious society by reducing the use of natural resources and Reduce deforestation and waste by seeking to eliminate the use of printed materials in office Conserve resources and support a more ecological society by reducing demand for plastic, of which only approximately 10 percent of what has been produced has ever been recycled. Instead, utilize goods and servicewares that are durable or which can compost back into useful soil instead of sitting in landfills for hundreds of years or being incinerated after a single use The U.S. Department of Agriculture estimates that roughly 30 percent of edible food goes to waste. Prevention is the first step to reducing food waste. Management of food and scraps to achieve the highest beneficial use is next. Beneficial uses include donations to feed people and animals, conversion to fuel, energy capture, and composting. Measurement of fuel use from services and goods events rely on is a critical step in understanding the scale of the environmental impact and where there may be opportunities to reduce it. Many suppliers track this data internally (because they pay for fuel) and can share it when requested, making calculations of event-related impact more accurate. Measurement of total electricity use (in kWh) at year-round facilities (e.g. headquarters, warehouse/storage) whether owned or leased is a critical step towards understanding the scale of the environmental impact the organization is responsible for and where there may Measurement of electricity use (in kWh) at facilities occupied during the complete production of the event--beginning with load-in and ending with 'teardown' or clean-up--is a critical step towards understanding the scale of the environmental impact and where there Measurement of direct fuel use at year-round facilities (e.g. headquarters, warehouse/ storage) is a critical step in understanding the scale of the environmental impact and where Measurement of direct fuel use from events and their operations is a critical step in understanding the scale of the environmental impact and where there may be opportunities Estimating the types and amounts of fuel used to get people to and from events is a critical step in understanding the scale of the environmental impact and where there may be Measurement of fuel use from services and goods events rely on is a major step in understanding the scale of the environmental impact and where there may be opportunities to reduce it. Many suppliers track this data internally and can share it when requested. Measurement of the contribution of climate-changing greenhouse gases resulting from the services and goods events rely on, including the shipping of participant and/or spectator services items is a critical step in understanding the scale of the environmental impact and Measurement of the contribution of climate-changing greenhouse gases resulting from electricity used at venues events rely on is a critical step in understanding the scale of the Measurement of the contribution of climate-changing greenhouse gases resulting from travel necessary for participants, spectators, partners, sponsors, and volunteers is a critical step in understanding the scale of the environmental impact and identifying opportunities to Measurement of the contribution of climate-changing greenhouse gases generated in the production and transportation of key event-production related purchases is a critical step in understanding the scale of the environmental impact and identifying opportunities to

Directive from organizational leadership enables and encourages action in accordance with Directive from organizational leadership enables and encourages action in accordance with Purpose-driven organizations add value in many ways to the communities they serve and in turn production of greenhouse gas emissions associated with human activities in order to prevent the

The movement of large amounts of people and goods necessary to stage mass gatherings is one of the primary sources of event-related contributions to climate change. Thoughtful

event design minimizes the use of sub-urban or rural locations because they require more transit-related energy use and create attendance barriers, especially for people who rely on public transit and active modes of transit. Efforts should be made to concentrate events and ancillary gatherings in centralized locations easily accessible by public transit, shuttles, and pedestrian modes while minimizing the need for single-occupancy vehicle based travel to Attendees travel to and from events is routinely responsible for a majority share of eventrelated GHG emissions. While a long-haul flight generates roughly 2 metric tons of GHG emissions, taking public transit to a local event generates an exceedingly small amount by comparison, while cycling, walking and other active modes generate negligible amounts (only respiration). Make a habit of encouraging and even incentivizing the use of bus, rail, subway, cycling and carpooling to minimize the climate impacts of attendee travel. Reducing the GHG impacts of event operations reduces the human contribution of GHG into the atmosphere that affects the global carbon cycle and causes warming. The most responsible organizations are those that demonstrate a commitment to continual Procuring GHG emissions-free electricity for event-related operations, whether purchased or generated at event venues and sites, is a key tactic to reduce the scale of environmental impact resulting from event productions and support the global transition to renewable energy sources that produce fewer climate-changing emissions than their fossil fuel counterparts. Even with the most determined efforts to reduce direct energy use, and thus GHG emissions, most organizations still generate some GHG emissions that contribute to climate change. The primary current means of taking responsibility for the environmental harm caused by those emissions is to ensure that an equivalent amount is absorbed via natural 'carbon sinks,' or, that atmospheric emissions are prevented elsewhere in the natural carbon cycle. When considering and purchasing voluntary carbon offsets, it is recommended (but not required) that they be verified by a third-party (e.g. Gold Standard, Verified Carbon Standard, Climate Action Reserve, Clean Development Mechanism). Measurement of the quantity and types of materials events generate that are recycled is a critical step in identifying and understanding opportunities to move towards more circular material flows. Ensure waste haulers report final waste quantities by type, volume and Measurement of the quantity and types of materials events generate that are recycled (compost is a form of re-cycling the elements contained in organic materials) is a critical step in identifying and understanding opportunities to move towards more circular material Measurement of the quantity and types of materials events generate that are sent to landfill or incineration is a critical step in identifying and understanding opportunities to move towards Measurement of the quantity and types of materials that are recycled (compost is a form of re-cycling the elements contained in organic materials) is a critical step in identifying and understanding opportunities to move towards more circular material flows. Measurement of the quantity and types of materials recycled is a critical step in identifying and understanding opportunities to move towards more circular material flows. Measurement of the quantity and types of materials operations generate that are sent to landfill or incinerated is a critical step in identifying and understanding opportunities to move towards Rougly 30 percent of edible food goes to waste according to the U.S. Department of Agriculture. Prevention and donation are the first steps to reducing food waste. Management of food and scraps to achieve the highest beneficial use is next. Recycling is an integral tactic of a more circular system to meet humans' material wants and needs. It reduces demand for raw materials and resources while extending the usefulness of Waste reduction is the ideal recommended waste management technique because it Measurement is an imperative first step towards better conservation and management Efficient water use practices should be implemented at every event, even those held in rainy places. Measurement is an imperative first step towards better conservation and Efficient water use practices and fixtures should be implemented at all facilities. Efficient water use practices should be implemented at every event, even those held in rainy Increase the likelihood that people who speak different languages feel included by reducing language barriers. Reduce language barriers by making public information regarding ticketing/purchasing/registration, websites, advertising communications, and on-site signage available in multiple languages, particularly when there is a second language commonly Provide information on the organization's website about accommodations available and not available to guests. Or provide a mechanism (e.g. contact form or information) for people to ask a question or request an accommodation. This practice is not about the ability of organizers to meet individual or specialized accommodations requests (e.g. closed captioning, listening devices, quiet zones, escorts to and from event and transit/parking areas), but to ensure that people have a way to make their needs known and be responded to in a timely manner. For a person with a need for specific accommodations, information about the organizers' ability to meet their needs is important when deciding whether to That event sites be accessible to people with physical and ambulatory disabilities is expected and compulsory. A site tour should be performed at all permanent and temporary event venues to identify difficult-to-navigate areas (e.g. gates, vertical transitions, carpets, gravel, and loose flooring are difficult to travel across in a wheelchair or scooter) and address them according to the guidance offered by the Americans with Disabilities Act or comparable international Ableism refers to discrimination and social prejudice against people with disabilities or who are perceived to have disabilities. Sports are an area of society in which ableism is often evident and apparent. Think and work diligently to create clear ways for people with differing mobilities to engage and participate in events. For spectator sports: Providing service(s), resources, and other accommodations to assist people who are blind, deaf, have limited ambulatory mobility, who are developmentally delayed, who experience mental instability and/or sensory sensitivity can enhance their enjoyment of recreational and competitive sporting events. See the resource referrals for additional detail. For participatory events: Host events that include differently-abled athletes. Create opportunities for direct participation of individuals with varied mobility types. Typical barriers for people with disabilities to participate in sport include: lack of awareness on the part of people without disabilities as to how to involve people with disabilities adequately; lack of opportunities and programmes for training and competition; too few accessible facilities due to physical barriers (DePauw and Gavron 2005); too few accommodations to support the navigation of facilities and enjoyment of events, and; limited information and limited access to information and resources. Engagement and participation will look different across events and Educating staff and volunteers about access and equity etiquette equips them with the proper language and action steps to address any guest's needs and questions at events. Actions to host more diverse, inclusive events will necessarily include local demographic research and direct inquiry with representatives of various groups suspected or known to be underrepresented at the organization's events. Inquiry about whether they would like to participate and why they have not historically done so is encouraged. Research and direct no experience with the sport or event activity. Resources should be free or provided at a nominal cost to participate. In-person clinics with instruction or demo opportunities at events are ideal, 'Interactive' means offering something interesting for people to do. 'Educational' presumes that people can learn factual information about a topic. Whether its trivia or a game, a scavenger hunt, an inspirational figure appearance, a tour, or a competition—giving people opportunities to

engage with messages relating to social or environmental elements beyond a pamphlet sitting on Events catalyse economic activity, with the potential of positive benefit to a city or county where they occur, from the use of local vendors for event production needs, to patronage of local accommodations and businesses by visitors. Measuring or estimating the local economic activity resulting from events as an element of the overall economic stimulus from events can Local businessess, especially smaller ones, don't always have the capacity to maximize the opportunity provided by events as they come to and through their neighborhoods and cities. Level the playing field by helping them out with communications and marketing assets (such as ideas for special promotions, an opportunity to offer event attendees a coupon, offer to participate in a joint promotion campaign) or other information that can help them get the most business out of the buzz and potential traffic generated by the event(s). Making donations to groups that have purpose-driven missions in support of community and wider societal or planetary health helps that work to continue. Disclosure of donated goods and services is a practice in transparency, helping build trust about the organization's commitment to Disclosure of donated goods and services is a practice in transparency, helping build trust about the organization's commitment to contributing to the greater good. Many participation-based sport events, and some spectator sports organizations rely on volunteerism. Support for the delivery of events should adequately compensate the efforts of grassroots community groups, and should be both representative and inclusive of the Put specific mechanisms in place to ensure that funds can be raised for charity or community partners during the ticketing/registration process or at an event-related point-of-sale (e.g. Transparently disclosing the amount of funds raised for charities is critical to buliding and maintaining trust among all parties (event organizers, charity partners, people donating) and Events provide creative platforms to engage and educate people about charity partners' efforts while helping them raise funds for many important social and environmental causes. Transparently disclosing the amount of funds raised for charities is critical to buliding and maintaining trust among all parties (event organizers, charity partners, people donating) and Whether a booth, ancillary activity (e.g. employee volunteerism), special event, recognition via PSAs or video boards, signage or other form of drawing attention to their cause(s) and efforts, non-profit and charity partners working for the common good can advance their cause-related work with and through access to events, their employees and networks. Discounted or free co-marketing are acts of solidarity organizations can provide to non-profit and charity partners working for the common good to advance their work with and through access to events.
